MiniDash Reflection Prompts

The first issue with AI was that it had created a backend page instead of front-end page which I realized after running the code. The way I fixed it was prompting ChatGPT to create a front-end page instead where customers can order. The second issue I faced was how the page was displayed. The store names, menu items, checkout and order tracking were all on one page. I changed this by asking ChatGPT to separate everything into its own page. The last issue I had found with AI was when testing the page I found the cancel feature missing and was fixed by prompting ChatGPT to add it back in.

AI was most helpful in helping me write the code itself because I have no background and coding at all. It also helped me learn Visual Studio code and how to set up the files since I've never used it before. I would say there wasn't really anything that AI was least helpful in during my timing using for this project since I was learning everything from scratch and it was helpful with guiding me through this project.

One thing that I realized about how I prompted was how long my prompts were compared to my first and last slice. In my first prompt I was still giving ChatGPT all the information I needed for the project, so my prompts were long. By the end of the project my prompts were getting shorter for the small things I wanted to change.

The one design decision I made for myself was how I wanted the page to be setup in multiple pages instead of having everything in one page which made it look too crowded.

There wasn't really any feature that wasn't verified.
